/note="Vector: PWMAD4nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWM42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi[4732114]gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

// Lone lib="Coytricha plasmid UUGC10 library"
// Actione lib="Coytricha plasmid Tab blunt end-repaired with DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWM92 (gi|4733114|gp|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XII0-Gold (Stratagene) cells and selected for ampicillin resistance."

DNA from Oxytricha trifallax was blunt end-repaired with
TH DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed fro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

molar excess. Vector DNA was prepared from a derivative of pwD42 (gi[4732114]gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector INA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

Disclosure; SEQ ID NO 3; 48pp; English.

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replacement cells so the tissue of the fetal non-human mammal host.

Also described: (1) a CDNA sequence encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a morteix caid which hypridises to the CDNA of (1); (3) vector comprising the CDNA as in (1); (4) a host cell containing the vector as in (3); (5) a transgenic cell, tissue or animal comprising the vector as in (3); (5)
                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                           GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG 60
facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility, or the direction of cell migration for use as a therapeutic; (7) a method for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or contility or the direction of migration by contacting a host cell expressing a homologue of UNC-53 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans unc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to conclude in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising; (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex, and (iii) analysing such a complex to dentify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans. Vertebrate complexes of UNC-53 can be used to promote neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative diseases or acute traumatic injuries or fiberotic diseases. The present constitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             engrafting foreign replacement cell; implanting foreign replacement cell; growth; differentiation; drug development; vaccine development; tissue transplantation; human disease study; cytomegalovirus; gene; ds.

mammalian host, and for producing chimeric mammals that can be used

```
replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the

The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to
                                                                                                                                                                                                                                                 9

This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastcoma protein (BP, see AAW62465) and BZF transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to traat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the BZF promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG 60

 This is the nucleotide sequence of pCTMI, a plasmid that was constructed from pCTM (see AAV40006) by digesting pCTM with XhoI and NotI and subcloning a 180 bp intron XhoI-NoII fragment from a pCMW-beta-gal vector. Plasmid pCTMI has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and E2F transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct os field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This is the nucleotide sequence of pCTMIE, a plasmid that was constructed by amplifying the SY40 enhancer from SY40 viral DNA by PCK, digesting the amplified product with BglII and inserting into BamHI-digested plasmid pCMTI (see AA40007). Plasmid pCTMIE has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastcoma protein (BP, see AA4062465) and E2F transcription factor (see AAM62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to trath hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New fusion polypeptide of, e.g. transcription factor - used to treat, e.g. hyper-proliferative disease such as cancer and restenosis.

Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pellB leader with the human immunoglobulin VHI leader sequence that permits the encoding of an Sfil cloning site without modification of the amino acid sequence. This fragment was then cloned as an EcoRJ/Blunt-HindIII rangement into NotI/Blunt-HindIII cut vector pRc/RsV to give pVACI. The single chain Fv for an individual patient can be inserted within the VHI leader sequence. This plasmid when encoding a single chain murine

```
The invention relates to a nucleic acid construct for delivery into living cells in vivo, to induce an immune response to a disease peptide antigen, where the construct directs expression of a fusion protein comprising the peptide antigen and the first domain of Frc. Also included are a nucleic acid vector comprising the above construct or vector and a method of producing a nucleic acid construct for vector and a method of producing a nucleic acid construct for inducing an immune response. The method comprises identifying a nucleic acid sequence encoding a disease peptide comprises dentifying a pricipes characteristic of the disease cloning the nucleic acid sequence, introducing the cloned nucleic acid into a vector which allows the antigen to be expressed as a fusion with a first domain Frc from tetanus toxin, and optionally isolating the construct from the vector. The construct for vector is used as a vaccine to induce an immune response, particularly to tumour antigene. The present sequence is vector

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel nucleic acid construct for inducing an immune response in vivo to an antigen, capable of directing the expression of a fusion protein that comprises an antigen and an adjuvant sequence derived from a plant viral coat protein. The construct of the invention has cytostatic and virucide activity. The nucleic acid construct is useful for inducing an immune response in a patient, for vaccinating a patient against an infectious disease caused by an antigen derived from a pathogen e.g. a virus, for treating a cancer patient or a patient with a predisposition to cancer and for treating a patient having a B cell malignancy, where the construct is encapsidated, and optionally, a second nucleic acid sequence encoding a further immunomodulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polypeptide is administered to the patient. The construct is also useful in medical treatment, and in the preparation of a vaccine for treating or preventing a disease state associated with the antigen. The sequence shows the complete sequence of vector pVAC1
                                                                                                                 9

```
The specification describes a microsphere comprising dihydrazide derivatised hyaluronic acid crosslinked to a nucleic acid (NA). The microspheres cause reduced inflammatory responses, and have increased safety and biodegradability. The microspheres are useful for transfecting a cell of a subject and for treating a subject having myocardial ischemia, by increasing cardiac anglogenesis. They are also useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hyaluronic acid micro spheres for use in gene therapy of myocardial ischemia and hemophilia, comprising dihydrazide derivatized hyaluronic acids crosslinked to nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating haemophilia. The present sequence represents the plasmid pCDNA3.1/GS, into which is inserted a polymucleotide sequence which is crosslinked to hyaluronic acid. The polymucleotide sequence encodes a vascular endothelial growth factor (VBGF)

```
The invention provides a nucleic acid molecule (I) comprising at least the functional part of blasticidin resistance (BS) gene, or its homolog, linked through a recognition sequence to at least one selected gene. (I) is useful in treatment comprising:(I) providing cells/tissues transfected with (I); (2) surgical administration of the cells/tissues to the patient to be treated; and optionally (3) monitoring the status of the cells/tissues by the patient. Therapeutic compositions comprising cells/tissues transformed with (I) is useful in identifying the role of genes in healthy and diseased tissue, in tissue engineering and in cosmetic surgery. Tissue engineering can be used to treat arthritis, joint replacement, skin grafts for burn victims, and replacement coronary arteries. Cosmetic tissue surgery includes rhinoplasty. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fusion protein; amyloid precursor protein; APP; transcription factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a recombinant vector which comprises DNA, consisting of an insertion cassette contained between at least two insertion sites, that encodes a small nuclear (sn) RNA. The invention is used to identify snRNA modifications that inhibit expression of transcription products (and the identified snRNA are used to suppress expression) for delivering antisense sequences to the nucleus and to create transgenic animals. The present DNA sequence is human snRNA, UI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant vector containing sequence for small nuclear RNA, useful e.g. for identifying variant snRNA that suppresses expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG 60

Flores OA, Hazuda DJ, Inglese J; Shi X, Simon AJ, Zuck PD;

DNA encoding a fusion protein of amyloid precursor protein, useful in screening for anti-Alzheimer agents, comprises a fused transcription factor.

Disclosure; Fig 32B-F; 193pp; English.

The present introduction describes a sum miscense of amyloid precursor protein (FP) comprising: (i) an amino acid sequence of amyloid precursor protein (APP), either the wild type, Swedish or NFEV versions; and (ii) a cranscription factor (TP), fused in frame to the C-terminus of (i). Also described: (1) an expression vector containing (1); (2) a cukaryotic cell cinhibite processing of APP, using the cells of (2). (i) has nootropic and neuroprotective activities. (i) can be used to produce cukaryotic cells that express FP and are useful in screening for agents that inhibit the express FP and are useful in screening for agents that inhibit correction of Alzheimer's disease. Cells that express FP can screen for inhibitors of: (a) beta- and gamma-secretases; and (b) cytoplasmic/extracellular APP signaling in a single assay. Cell-based assays may be free of interference from alpha-secretase activity and are homogeneous (no chromatography, immunoprecipitation or washing required) so well suited to high-throughput screening. The present sequence The present invention describes a DNA molecule (I) that encodes a fusion represents a plasmid nucleotide sequence from the present invention.

(http://sequence-www.stanford.edu/group/techdev/shear.htm)
The randomly sheared gDNA was chromatographed on sephacry1 5-400 to remove any small fragments and DNA eluting in the void volume was blunt-ended with T4 DNA Polymerase, treated with alkaline phosphatase to prevent the ligation of multiple fragments, ligated to Srf I-digested pCR-Script Amp (SK+) vector and transformed into E. coli strain XIIO Gold. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."

The present invention describes NOVX proceins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) at kit comportising in one or more described above and a carrier; (2) at the composition described above; (3) an isolated mucleic acid molecule which encodes a NOVX protein of the invention; (4) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) a cell comprising the mucleic acid molecule described above; (6) a cell comprising the mucleic acid molecule of presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (6) a disease associated with altered levels of expression of the above adsease associated with altered levels of expression of the above; (10) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for medulator of activity or of latency or predisposition to a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of such a pathology that the polypeptide; (12) a method for modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method of mammal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide is useful in method for producing the above polypeptide or the nucleic and antilipaemic activities, and can be used above; (13) method or procein continue may be used to diagnose, treat or prevent metabolic and molecule may be used to diagnose, treat or prevent metabolic diagnose, immune disorders such as Alzheimer's disease or Parkinson's disease undmand adabetes and various metabolic, the present invention mapping, itsue typing, preventive medicine and processer, inchronsome mapping, itsue typing, preventive medicine and processer, in chronsome mapping, itsue typ thson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; turajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton B; A, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; A, Mikets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; en AJ, Gangolli EA, Rieger DK, Spaderna SK; New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or Claim 20; Page 316-317; 586pp; English.

expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides may also be used as DNA production of antibodies and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (semilar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators and integonists of the expression and activity of NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypeptide antibodies agonists may also be used as antibodies and polymucleotide may be used in this way to prevent, diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, norexia, cancer, cancer-associated with obsity, the metabolic syndrome X and wasting disorders associated with obsity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and polynucleotides may be used to treat disorders associated with decreased

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disorder, bypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachaxia, multiple sclerosis or fertility. The nucleic acids may be used a hybridisation probes, in chromosomics. This sequence represents a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1839 AAGCGGCCGCTCGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCT 1898

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host dispets. Alzheimer's disease, Parkinson's disease, graft-versus-host chrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used a hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a human NOVX polynucleotide of the invention.
